

**MS-395 E-Business Technologies
Program #3
Server-side Form Validation**

Date: Monday, April 24, 2006

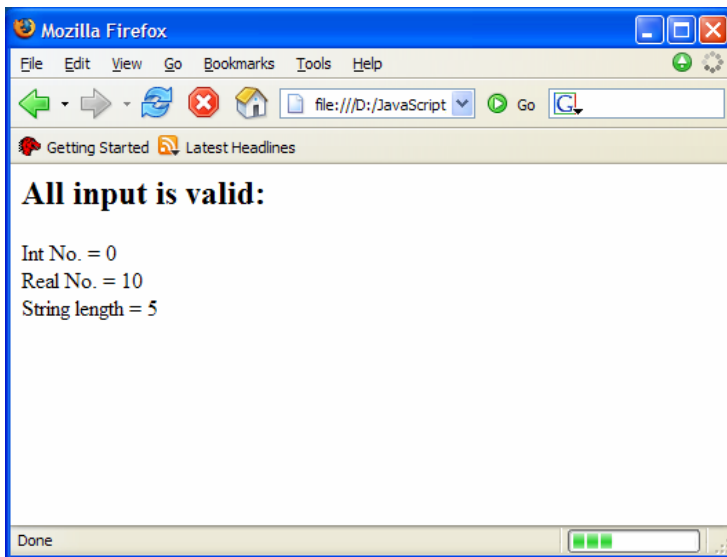

Due: Monday, May 1, 2006

Write the PHP script to validate the input form data entered by the user. The input screen appears below:

The screenshot shows a Mozilla Firefox browser window. The address bar is empty. The page content includes three input fields with labels and ranges: "Enter Int No.: 0 (0-99)", "Enter Real No.: 10.0 (0.0-10.0)", and "Enter String: hello". Below the fields is a "Submit Query" button. The status bar at the bottom shows "Done".

On successful completion, echo out the input parameters as show below:

The screenshot shows the same Mozilla Firefox browser window after a successful submission. The page content displays the message "All input is valid:" followed by the input values: "Int No. = 0", "Real No. = 10", and "String length = 5". The status bar at the bottom shows "Done".

If there are errors, then output a page that lists the fields in error.
