

Chapter 7 Using SQL in Applications

DATABASE PROCESSING
Fundamentals, Design,
and Implementation, 9/e

View Ridge Gallery

- View Ridge Gallery is a small art gallery that has been in business for 30 years
- It sells contemporary European and North American fine art
- View Ridge has one owner, three salespeople, and two workers
- View Ridge owns all of the art that it sells; it holds no items on a consignment basis

Copyright © 2004 Database Processing: Fundamentals, Design and Implementation, 9/e by David M. Kroenke

Chapter 7/2

Application Requirements

- View Ridge application requirements
 - Track customers and their artist interests
 - Record gallery's purchases
 - Record customers' art purchases
 - List the artists and works that have appeared in the gallery
 - Report how fast an artist's works have sold and at what margin
 - Show current inventory in a Web page

Copyright © 2004 Database Processing: Fundamentals, Design and Implementation, 9/e by David M. Kroenke

Chapter 7/3

View Ridge Data Model

Figure 7.2a View Ridge Database with Data Keys — Data Model

Copyright © 2004 Database Processing: Fundamentals, Design and Implementation, 9/e by David M. Kroenke

Chapter 7/4

View Ridge Data Model

- Problems: the keys for WORK and TRANSACTION are huge and the key for CUSTOMER is doubtful as many customers may not have an email address

16	1015

(e)

Sample Values

```

CREATE TABLE ARTIST (
    ArtistID INT NOT NULL PRIMARY KEY,
    Name VARCHAR(50) NOT NULL,
    Nationality VARCHAR(50) NOT NULL,
    Birthdate DATE NOT NULL,
    DeceasedDate DATE NOT NULL,
    CONSTRAINT ARTIST_PK PRIMARY KEY (ArtistID)
);

CREATE TABLE CUSTOMER (
    CustomerID INT NOT NULL PRIMARY KEY,
    Name VARCHAR(50) NOT NULL,
    Street VARCHAR(100) NOT NULL,
    City VARCHAR(50) NOT NULL,
    State VARCHAR(50) NOT NULL,
    ZipPostalCode VARCHAR(10) NOT NULL,
    Country VARCHAR(50) NOT NULL,
    AreaCode INT NOT NULL,
    PhoneNumber VARCHAR(15) NOT NULL,
    Email VARCHAR(100) NOT NULL,
    CONSTRAINT CUSTOMER_PK PRIMARY KEY (CustomerID)
);

CREATE TABLE WORK (
    WorkID INT NOT NULL PRIMARY KEY,
    Title VARCHAR(100) NOT NULL,
    Description VARCHAR(200) NOT NULL,
    Copy VARCHAR(50) NOT NULL,
    ArtistID INT NOT NULL,
    CONSTRAINT WORK_PK PRIMARY KEY (WorkID),
    CONSTRAINT WORK_FK FOREIGN KEY (ArtistID) REFERENCES ARTIST (ArtistID)
);

CREATE TABLE TRANSACTION (
    TransactionID INT NOT NULL PRIMARY KEY,
    DateAcquired DATE NOT NULL,
    AcquisitionPrice DECIMAL(10,2) NOT NULL,
    PurchaseDate DATE NOT NULL,
    SalesPrice DECIMAL(10,2) NOT NULL,
    AskingPrice DECIMAL(10,2) NOT NULL,
    CustomerID INT NOT NULL,
    WorkID INT NOT NULL,
    CONSTRAINT TRANSACTION_PK PRIMARY KEY (TransactionID),
    CONSTRAINT TRANSACTION_FK1 FOREIGN KEY (CustomerID) REFERENCES CUSTOMER (CustomerID),
    CONSTRAINT TRANSACTION_FK2 FOREIGN KEY (WorkID) REFERENCES WORK (WorkID)
);
    
```

CHECK CONSTRAINT

Does not work in MS Access

- CHECK CONSTRAINT defines limits for column values
- Two common uses
 - Specifying a range of allowed values
 - Specifying an enumerated list
- CHECK constraints may be used
 - To compare the value of one column to another
 - To specify the format of column values
 - With subqueries

Copyright © 2004 Database Processing: Fundamentals, Design and Implementation, 9/e by David M. Kroenke Chapter 7/13

SQL Views

Views do work in MS Access!

- SQL view is a virtual table that is constructed from other tables or views
- It has no data of its own, but obtains data from tables or other views
- SELECT statements are used to define views
 - A view definition may not include an ORDER BY clause
- SQL views are a subset of the external views
 - They can be used only for external views that involve one multi-valued path through the schema

Copyright © 2004 Database Processing: Fundamentals, Design and Implementation, 9/e by David M. Kroenke Chapter 7/14

SQL Views

- Views may be used to
 - Hide columns or rows
 - Show the results of computed columns
 - Hide complicated SQL statements
 - Provide a level of indirection between application programs and tables
 - Assign different sets of processing permissions to tables
 - Assign different sets of triggers

Copyright © 2004 Database Processing: Fundamentals, Design and Implementation, 9/e by David M. Kroenke Chapter 7/15

Example: CREATE VIEW

Insert Figure 7-6

```
CREATE VIEW
  CustomerNameView AS
SELECT Name AS
  CustomerName
FROM CUSTOMER;

SELECT *
FROM CustomerNameView
ORDER BY CustomerName;
```

Copyright © 2004 Database Processing: Fundamentals, Design and Implementation, 9/e by David M. Kroenke Chapter 7/16

Updating Views

- Views may or may not be updatable
- Rules for updating views are both complicated and DBMS-specific
- Guidelines: Insert Figure 7-13

Copyright © 2004 Database Processing: Fundamentals, Design and Implementation, 9/e by David M. Kroenke Chapter 7/17

Embedding SQL In Program Code

Triggers & Stored Procedures in MS Access require VBA

- SQL can be embedded in triggers, stored procedures, and program code
- Problem: assigning SQL table columns with program variables
- Solution: object-oriented programming, PL/SQL
- Problem: paradigm mismatch between SQL and application programming language
 - SQL statements return sets of rows; an applications work on one row at a time
- Solution: process the SQL results as pseudo-files

Copyright © 2004 Database Processing: Fundamentals, Design and Implementation, 9/e by David M. Kroenke Chapter 7/18

Triggers

Requires VBA to work in MS Access

- A trigger is a stored program that is executed by the DBMS whenever a specified event occurs on a specified table or view
- Three trigger types: BEFORE, INSTEAD OF, and AFTER
 - Each type can be declared for Insert, Update, and Delete
 - Resulting in a total of nine trigger types
- Oracle supports all nine trigger types
- SQL Server supports six trigger types (only for INSTEAD OF and AFTER triggers)

Copyright © 2004 Database Processing: Fundamentals, Design and Implementation, 9/e by David M. Kroenke Chapter 7/19

Firing Triggers

- When a trigger is fired, the DBMS supplies
 - Old and new values for the update
 - New values for inserts
 - Old values for deletions
- The way the values are supplied depends on the DBMS product
- Trigger applications:
 - Checking validity (Figure 7-14)
 - Providing default values (Figure 7-15)
 - Updating views (Figure 7-16)
 - Enforcing referential integrity actions (Figure 7-17, 7-18)

Copyright © 2004 Database Processing: Fundamentals, Design and Implementation, 9/e by David M. Kroenke Chapter 7/20

Stored Procedures

Requires VBA to work in MS Access

- A stored procedure is a program that is stored within the database and is compiled when used
 - In Oracle, it can be written in PL/SQL or Java
 - In SQL Server, it can be written in TRANSACT-SQL
- Stored procedures can receive input parameters and they can return results
- Stored procedures can be called from
 - Programs written in standard languages, e.g., Java, C#
 - Scripting languages, e.g., JavaScript, VBScript
 - SQL command prompt, e.g., SQL Plus, Query Analyzer

Copyright © 2004 Database Processing: Fundamentals, Design and Implementation, 9/e by David M. Kroenke Chapter 7/21

Stored Procedure Advantages

- Greater security as store procedures are always stored on the database server
- Decreased network traffic
- SQL can be optimized by the DBMS compiler
- Code sharing resulting in
 - Less work
 - Standardized processing
 - Specialization among developers

Copyright © 2004 Database Processing: Fundamentals, Design and Implementation, 9/e by David M. Kroenke Chapter 7/22

Using SQL In Application Code

This does work with MS Access

- SQL can be embedded in application programs
- Several SQL statements need to be executed to populate an external view
- The application program causes the statements to be executed and then displays the results of the query in the form's grid controls

Copyright © 2004 Database Processing: Fundamentals, Design and Implementation, 9/e by David M. Kroenke Chapter 7/23

Using SQL In Application Code (cont.)

- The application program also processes and coordinates user actions on a form, including
 - Populating a drop-down list box
 - Making the appropriate changes to foreign keys to create record relationships
- The particulars by which SQL code is inserted into applications depend on the language and data-manipulation methodology used
